The Working Group 5 of the International Medical Informatics Association (IMIA) dedicates its work to information systems in primary and ambulatory care. The first conference of this Working Group in Hannover in 1980 produced a review of the state of the art of that time and gave perspectives for future development (Rienhoff, O. and Abrams, M.E. (eds.): The Computer in the Doctor's Office, North-Holland, Amsterdam: 1980). In the meantime, a rapid development has taken place. Therefore it seemed appropriate to hold another working conference which was conducted in Munich, December 2-6, 1985. The goal of this working conference was to review the developments in this field and to critically evaluate the progress achieved so far. The conference addressed general principles in

system development and prerequisites for their successful introduction into routine use. Furthermore, the topics of expert systems and new technologies were discussed in the context of their usefulness and usability in ambulatory care systems. As before, it became very clear that actual computer systems to support ambulatory and/or primary care have to meet the conditions of the health care delivery systems, into which they are to be placed. The Working Group 5 of the International Medical Informatics Association (IMIA) is dedicated to information systems in primary care with special emphasis on computer systems in the doctor's office. Accordingly, a conference was held in Hannover in 1980 where the first approaches were described and experiences in system analysis, system construction and evaluation were discussed (Rienhoff, O. and Abrams, M.E. (eds.): The Computer in the Doctor's Office, North-Holland, Amsterdam: 1980). Computer hardware and software development has been rapid over the last years. Thus the prerequisites for a successful support of the work of the physician in his office have improved. But system construction still lags behind and the actual penetration of systems is lower than 2 % of the doctors' offices in most countries. This applies to industrialized countries. However, attempts are made everywhere to improve primary care by means of modern information technology. Information systems depend upon the real environment into which they are placed: administrative

procedures govern priorities and procedures in doctor's office computers, possibilities to defray cost upon the various carriers or the patients have a great influence on the propagation of systems. Furthermore, various procedures of accounting or re-imburement may lead to a facilitation or to a delay of the introduction of systems. The 'art of medical practice' has reached a comparable standard within at least the industrialized countries. This key resource provides insight and guidance to managing ambulatory surgery centers (ASCs) from a broad spectrum of expertise. Intended for a wide audience of healthcare professionals, this book covers topics such as regulatory issues, outpatient pediatric anesthesia, inventory management, personnel training, the culture of safety, and sedation standards. The format found in each chapter is designed intentionally to function as an educational manual. Many chapters are supplemented by high quality figures and tables to aid in visual learning. This text brings together authors from diverse professions including lawyers, administrators, surgeons, anesthesiologists and architects - all of whom have contributed their expertise to address the multitude of subjects that pertain to ASCs. cs.nurse.fund\_surg Text provides comprehensive coverage of women's health information. Reflects the latest research and discusses pregnancy, hormone replacement therapy, and frequently encountered medical problems. Updated for its Seventh Edition, Principles of Ambulatory Medicine is the definitive reference for all clinicians caring for adult ambulatory patients. It provides in-depth coverage of the evaluation, management, and long-term course of all clinical problems addressed in the outpatient setting. A major focus is on preventive care, grounded in excellent patient-physician communication. This

edition features increased coverage of preventive care, particularly the impact of genetic testing as a disease predictor. For easy reference, the book is organized by body system and each chapter begins with an outline of key topics. References to randomized controlled clinical trials, meta-analyses, and consensus-based recommendations are boldfaced. A clear, hands-on outline of best practices for infection prevention that directly improve patient outcomes across the healthcare continuum. Since the publication of the 7th edition of this book, there has been a remarkable increase in information in several clinical areas, including cardiology, immunology and oncology. This rapid knowledge expansion has led to practice changes for family physicians and other primary care providers. Patients are now discharged from tertiary care hospitals to their home communities with life sustaining left ventricular assist "heart pumps". Hepatitis C, once an incurable illness, is now routinely cured. Oncology treatment regimens are increasingly becoming ambulatory and individualized. The decreased cost and increasing availability of health monitoring devices will make it possible for physicians to remotely check on the health status of their patients in their homes. With the ongoing and worsening shortage of family physicians across the US, the practice model for family medicine in the future may tend toward a family physician supervising a cast of mid-level

providers as they care for a panel of patients, versus the physician providing the majority of care. All of these changes will require practice pattern changes and a need for up to date sources of information for the family physician. In addition, the "family" of family medicine academic organizations is undertaking a major review of the practice, training, funding and evaluation of all aspects of family medicine. Eight family medicine organizations have launched the "Family Medicine for America's Health" (FMAHealth) with the expressed purpose "to strategically align work to improve practice models, payment, technology, workforce and education, and research to support the triple aim". This project has moved past the study phase and will soon move to the implementation phase. This book is organized into short, focused chapters almost exclusively dedicated to topics relevant to daily practice. All lead authors are themselves accomplished family physicians who can specifically address the needs, concerns, and interests of this crucial profession. As one of the key reference textbooks for family medicine, it is very important to provide the most up-to-date knowledge to support learners and practitioners of family medicine in the face of rapidly expanding clinical knowledge and the extensive self-examination of family medicine. Family Medicine: Principles and Practice, 8th Edition, is a must-have reference for medical students, residents, practicing physicians, nurse practitioners and physician assistants

Infection control is an urgent priority in ambulatory settings as a result of the growing number of immunocompromised patients and the increasing complexity of care. This book covers IC practice in a variety of settings, providing background information, reviewing basic principles, and outlining recommended practices. "According to the International Association for Ambulatory Surgery (IAAS), ambulatory surgery should be defined as: 'an operation/procedure, excluding an office or outpatient operation/procedure, where the patient is discharged on the same working day'. The origins of ambulatory surgery can be traced back to the pioneering work of James Nicholl at the Glasgow Royal Hospital who reported 8988 paediatric day case procedures between 1899-1908. Despite initial scepticism from the surgical profession, there has been a rapid expansion in the complexity and amount of ambulatory surgery in recent years: between 1989-2003 the percentage of elective surgery undertaken as day case in the UK increased from 15% to 70%. Many health services have set targets for the percentage of elective surgeries to be done as day-case procedures and in the UK this target is set at 75%"-- Publisher Description (unedited
